

DM – Nuclear medicine

Clinical problem

Radionuclide study

CAD

MPI : ^{201}Tl , $^{99\text{m}}\text{Tc}$ -agents, ^{18}F -FDG

DAN

**Imaging of Sympathetic
Innervation** : ^{123}I -MIBG, ^{11}C -HED

Gastroparesis D.

Gastric emptying : $^{99\text{m}}\text{Tc}$ -col. meal

D. Cardiomyopathy

Systolic / Diastolic LV function
 $^{99\text{m}}\text{Tc}$ -RBC-MUGA, $^{99\text{m}}\text{Tc}$ -MIBI-gated SPECT

D. Nephropathy

GFR measurement : ^{51}Cr -EDTA

D. Foot

Bone scan : $^{99\text{m}}\text{Tc}$ -MDP
Infection imaging : $^{99\text{m}}\text{Tc}$ -HMPAO- WBC

Heart Failure

*inability of blood pumping
in accordance to metabolic demands,
under normal filling pressure*

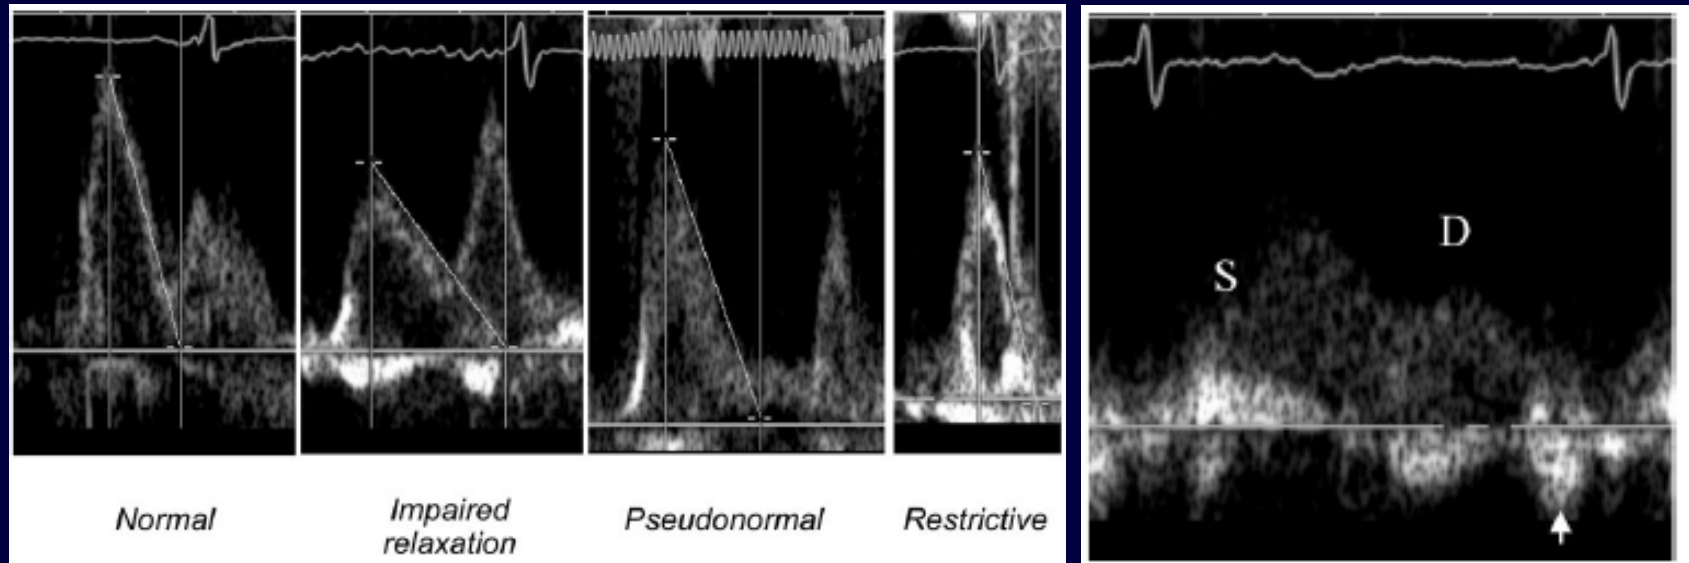

Systolic Dysfunction

↓ LVEF + ↑ LVEDV

Diastolic Dysfunction

↑ LV filling pressure
LVEF, LVEDV, constant

Diabetic Cardiomyopathy: Evidence, Mechanisms, and Therapeutic Implications

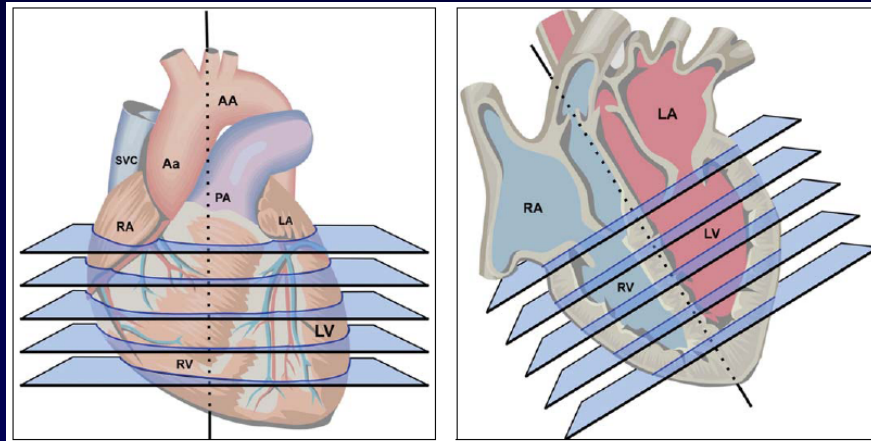

$$Vol = \sum_{i=1}^n \pi r_i^2 \cdot h$$

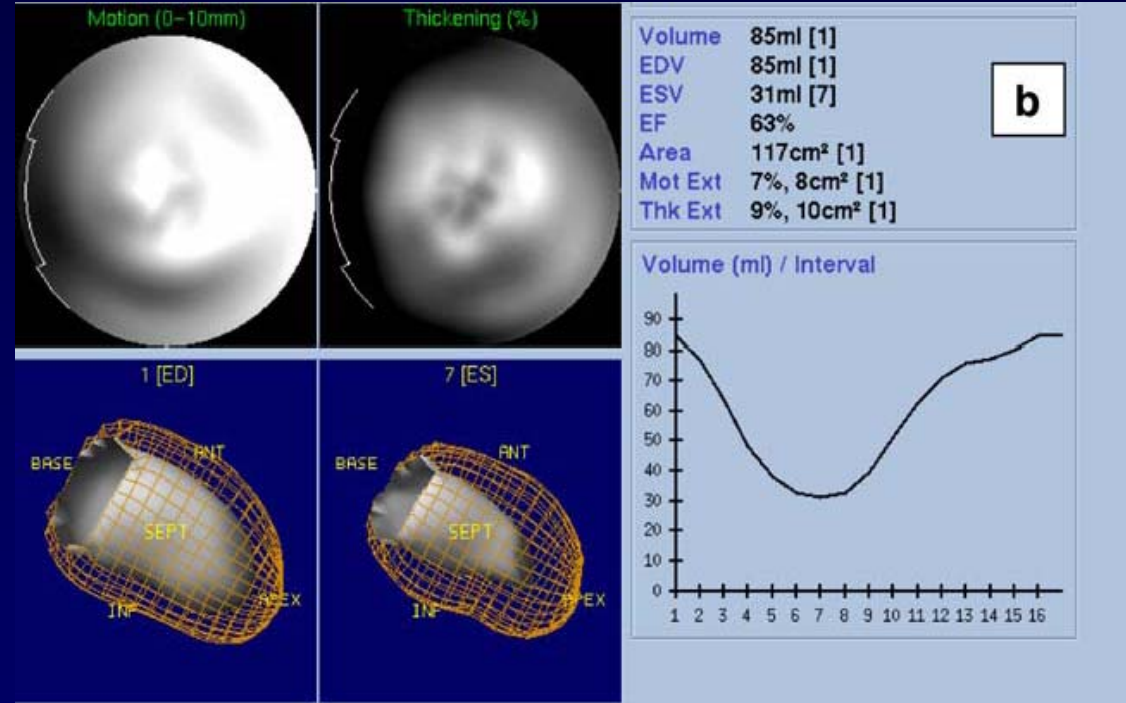

$$EF = \frac{Vol_{ed} - Vol_{es}}{Vol_{ed}}$$

MDCT Determination of Volume and Function of the Left Ventricle: Are Short-Axis Image Reformations Necessary?

Radionuclides Ventricular measurements 1 (Volumetric)

Radionuclides Ventricular measurements 2 (ERNV)

Tracer = ^{99m}Tc -labelled RBC

d, AF adult

24 frames/cycle radionuclide ventriculography

ED, end diastolic;
ES, end systolic

Left ventricle time-activity curve (upper).
Open boxes represent data, approximated by the curve.
Lower curve is the 1st derivative of the upper one, thus representing rates

ET, emptying time;
FT, filling time;
PFR, peak filling rate;
TPF, time to peak filling rate;
1/3FF, first third filling fraction;
A/V, atrial contribution to ventricular filling

RV Right Ventricle
LV Left Ventricle
BKG Background
ED End Diastolic
ES End Systolic
Cts activity in counts

Ejection Fraction (EF)

$$\left[\frac{EDcts - EScts}{EDcts} \right] \times 100$$

A

SHORT AXIS

LONG AXIS HORIZONTAL

LONG AXIS VERTICAL

B

c-VEST

ERNV measurements

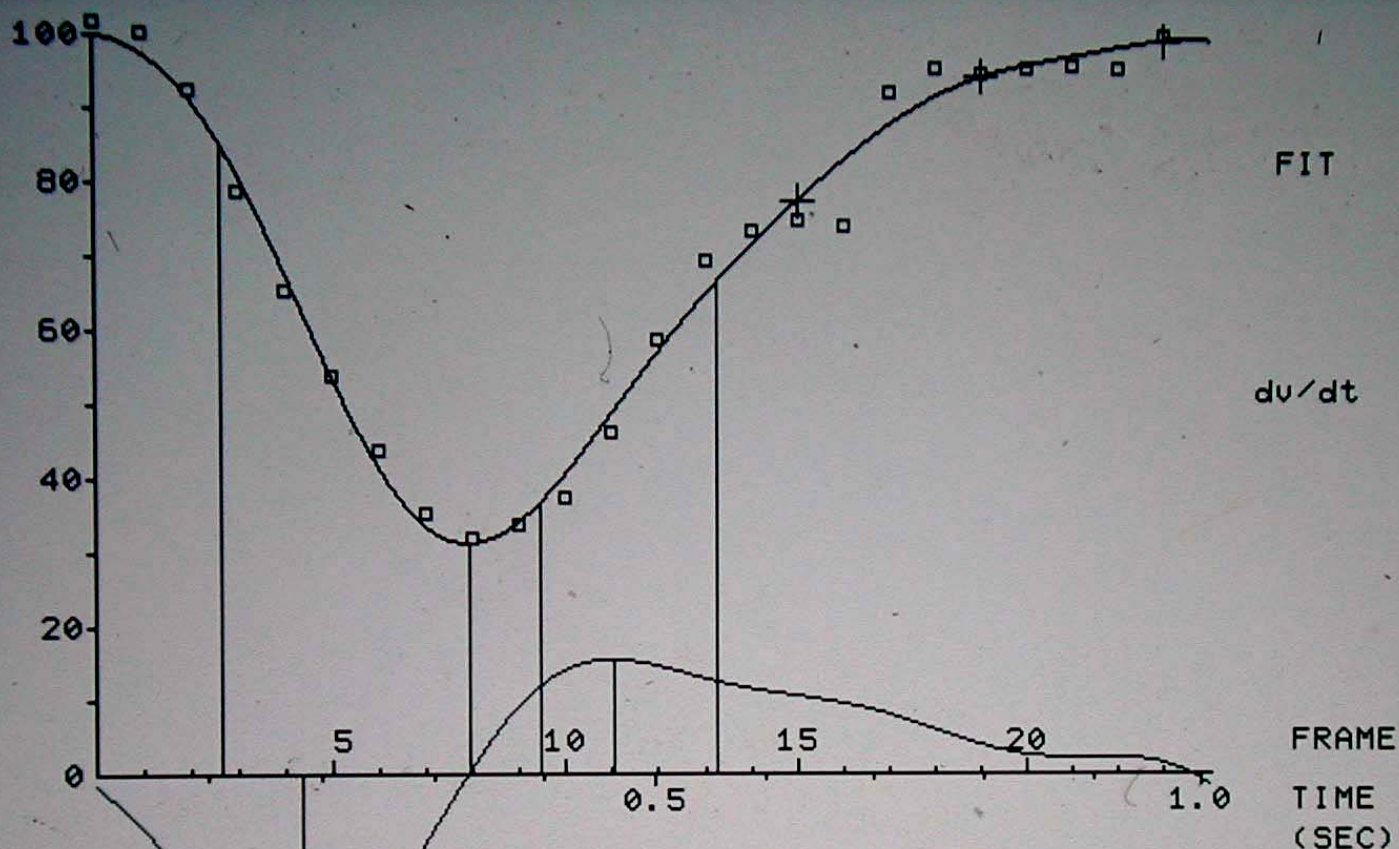

- LVEF, RVEF, stress-rest
- Regional LV wall motion, stress-rest
- LV diastolic function
- EDV, ESV, SV, CO
- Shunt quantification
- Intra- Inter- ventricular contraction synchronization

16	27	29	2	7.4%

LVEF, left ventricular ejection fraction.

Fig. 2

Is Magnetic Resonance Imaging the 'Reference Standard' for Cardiac Functional Assessment? Factors Influencing Measurement of Left Ventricular Mass and Volumes

Steen H et al. Clinical Research in Cardiology, Volume 96, Number 10 (2007)

	$(1^{st}+2^{nd})/2$	$1^{st} - 2^{nd}$	\uparrow (%)	\downarrow (%)
EF (%)	67.3±7.2	-0.2±3.8	6.2 (9.2)	6.5 (9.6)
PFR (SV/sec)	4.8±1.2	0.3±0.9	1.8 (38.8)	1.2 (25.0)
1/3 FF (%SV)	44.0±15.7	-1.4±11.5	17.7 (42.1)	20.4 (48.6)
rTPF (%)	17.9±4.3	0.9±5.2	9.4 (52.7)	7.8 (42.3)
TPF (msec)	144.4±35.1	6.4±44.4	79.5 (55.1)	66.8 (46.3)
A/V (%SV)	24.9±9.5	0.2±7.7	13.0 (52.0)	12.5 (50.3)

The minimum **change** of a parameter [\uparrow (%) or \downarrow (%), percent in parentheses] that could be considered as true at the **95% level** of certainty provided an estimate of **reliability**. The lower the change required, the better the reliability. Note, that in contrast to EF where a <10% change is adequate, approx. 25-50% change is required for diastolic parameters before they can be confidently considered true

Results 6 : Bland-Altman analysis

EF

1/3 FF

the agreement of the diastolic RNV index 1/3 FF between the RNV sessions was unsatisfactory, indicating limited reliability, in contrast to the ejection fraction

Diastolic function

Relations between HR-PFR,
& HR-1/3FF in normal
children

Cardiac Abnormalities in Diabetic Patients With Neuropathy

Effects of aldose reductase inhibitor administration

Table 2—Radionuclide ventriculography measures at rest

	Baseline	Week 52	Change	P value
